WHAT TRULY DRIVES CONTRACEPTIVE UPTAKE?

Real-World Evidence from 419 Women of Reproductive Age in Mkuranga District

In this cross-sectional study of 419 women, modern contraceptive prevalence was 25.1%. Using Modified Poisson

SAD

KEY EPIDEMIOLOGICAL HIGHLIGHTS

PREVALENCE: 25.1%
95% CI: 21.1% – 29.4%

- 105 of 419 women currently protected
- 28.1% among married / cohabiting women
- Injections top choice (45.7%), Implants 27.6%

1 in 4 women currently using

KNOWLEDGE IMPACT
45.8% High Composite Score

- Injection awareness highest (90.7%)
- Sterilization awareness lowest (24.8%)
- High knowledge nearly doubles use (aPR = 1.89)

Comprehensive awareness matters

PARTNER DYNAMICS
The Decisive Factor

- Frequent discussion yields 2.7x higher use
- Partner support increases use by +85%
- Parity ≥3 children had lower use (aPR = 0.68)

Male involvement is crucial

MODIFIED POISSON REGRESSION: INDEPENDENT PREDICTORS (aPR)

PREDICTOR VARIABLE	COMPARISON / CONTRAST	aPR (95% CI)	P-VALUE	EPIDEMIOLOGICAL INTERPRETATION
Contraceptive Knowledge	High (≥ mean) vs. Low (< mean)	1.89 (1.35 – 2.65)	<0.001*	+89% higher prevalence of current use
Partner Communication	Frequent vs. Never	2.67 (1.57 – 4.52)	<0.001*	2.7x higher uptake; strongest single driver
Partner Communication	Once or twice vs. Never	2.39 (1.44 – 3.99)	<0.001*	Even occasional dialogue doubles use
Partner Support	Supportive vs. Not	1.85 (1.14	0.013*	Male approval independently
